

Variables

Variables are nothing but containers that can be used to store some data / information

water ==> container(water bottle)

data(age of a person, name of a person, city of a person) ==> container(variable)

1) Write a java program to store the age of a person
40

_____ age =

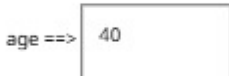

After we create a variable, we should also tell the type of that variable

datatype variable =

data type ==> Tells what type of data this variable will store

String name =

int age = 40;

age = 60

250 ml of water ==> water glass

1lt of water ==> water bottle

1000lt of water ==> water tank

we have byte, short, int and long data types

byte ==> small container ==> -128 to 127

short ==> larger container ==> -32k to +32k

변환 함수의 계산 방법				
Q (변환 후)	변환 후	변환 후	변환 후	
0	0000 0000	0000 0000	00000000 0000	00000000 0000
1	0000	0	0000	0000
2	0000	00	000000	000000
3	00	00	0000000000	0000000000
4	0000	00	00000000000000	00000000000000
