

Cake Shop Management System

Java OOP Practice Question

Create a Java program for a Cake Shop to print the total number of cakes available/created.

Create a class called **Cake** with the following requirements:

Instance variables:

- cakeName
- price

Static variables:

- cakesCount
- shopName = "Sweet Treats"

Constructor:

Create a constructor that initializes the cake name and price, and increments cakesCount.

Instance method:

Create an instance method **displayCakeDetails()** to display:

- Cake name
- Cake price
- Cake category

Use if-else-if-else to determine the cake category:

- Price $\geq$ 2000 $\rightarrow$ "Premium Cake"
- Price $\geq$ 1000 $\rightarrow$ "Regular Cake"
- Price $<$ 1000 $\rightarrow$ "Budget Cake"

Static methods:

- Create a static method **displayTotalCakes()** to print the total number of cakes created.
- Create another static method **displayShopName()** to print the cake shop name.

In main()

Create 5 cake objects:

Cake Name	Price
Chocolate Cake	2500
Vanilla Cake	1200

Butterscotch Cake	1800
Pineapple Cake	900
Red Velvet Cake	3000

Then:

- Display the shop name.
- Display the details of all 5 cakes.
- Display the total number of cakes created.

Task: Write the complete Java program using instance variables, static variables, constructor, instance methods, static methods, and if-else conditions.
