

Encapsulation

Every object we take, it has most important component

Object ==> Fan ==> motor ==> shield

A.C ==> Coolant ==> shield

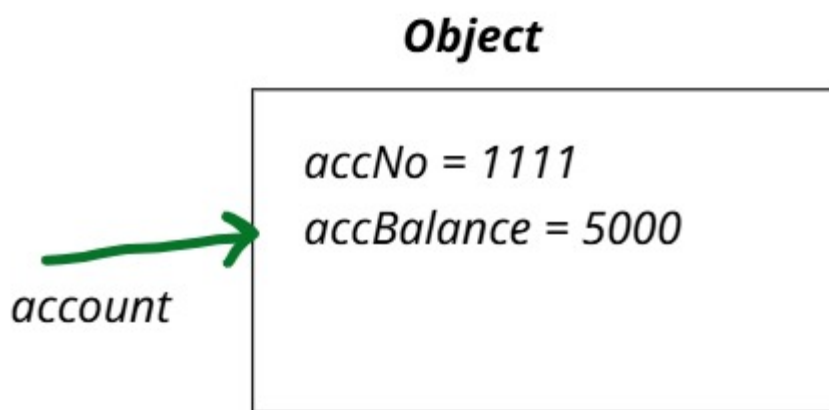

Bulb ==> Filament ==> glass

*.....
.*

Java Program ==> Objects ==> every object has some important component ==> for that important component security should be given ==> **ENCAPSULATION**

Providing security to the most important component of the object is only called as ENCASULATION

new BankAccountt();

If we make a variable as private, that avriables is not accessible in other classes

without private ==> good and bad person both can access

with private ==> good and bad person both cannot access

good should be able to access and bad fellow should not be able to access ==> 2 people(setters and getters)

setter is a method in java that is used to set/update the value in a private variable

getter is a method in java that is used to get/read the value from a private variable

Book ==> int title, int pageNo
