

Banking Application

Java ==> if a person is entering input

as "Raju" ==> string, R ==> string

'R' ==> Character

"R" ==> String

next() and nextLine()

"Raju Ramu"

100 == 200 ==> only for numbers

equals() ==> only for strings

```
int demo()
```

```
{
```

```
-----
```

```
-----
```

```
-----
```

```
}
```

```
account()
```

```
System.out.println("Enter your name:");
```

```
String enteredName = new Scanner(System.in).nextLine();
```

```
System.out.println("Enter your age:");
```

```
byte enteredAge = new Scanner(System.in).nextByte();
```

```
System.out.println("Enter your mobile no:");
```

```
int enteredMobileNo = new Scanner(System.in).nextInt();
```

```
System.out.println("Enter your aadhar no:");
```

```
int enteredAadharNo = new Scanner(System.in).nextInt();
```

```
System.out.println("Enter your city:");
```

```
String enteredCity = new Scanner(System.in).nextLine();
```

```
System.out.println("Enter the initial amount for deposit:");
```

```
double enteredInitialBalance = new Scanner(System.in).nextDouble();
```

```
int age
```

```
f1(){ int age ==> printf(age) }
```

```
f2(){ printf(age) } X
```

```
f3(){ printf(age) } X
```

```
f4(){ printf(age) } X
```

```
ba = new BankAccount();
```

```
BankAccount
```

ba →
